Know Your River – River Ystwyth Salmon and Sea Trout Catchment Summary

Introduction

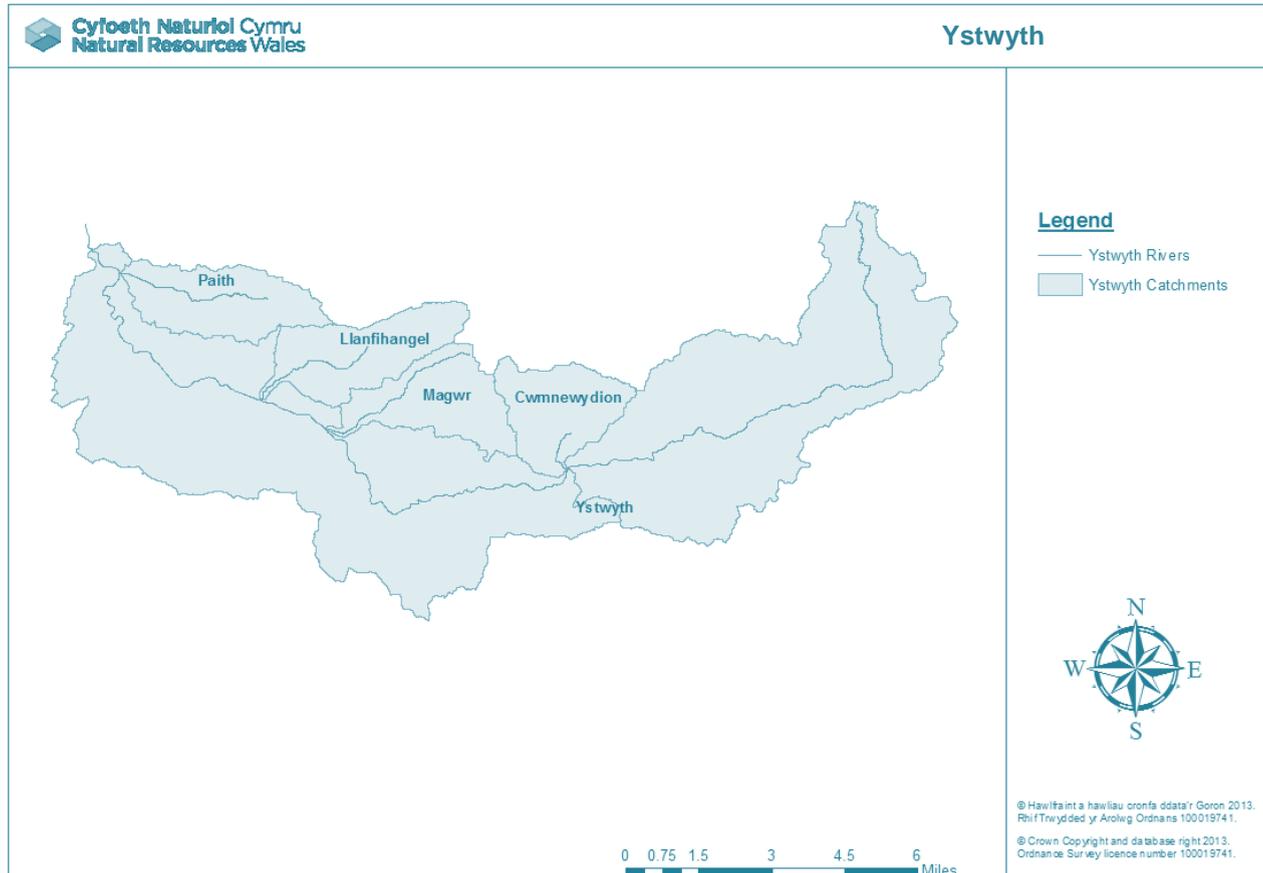

This report describes the status of the salmon and sea trout populations in the Ystwyth catchments. Bringing together data from rod catches, stock assessments and juvenile monitoring, it will describe the factors limiting the populations and set out the challenges faced in the catchment.

Action tables set out habitat improvements to restore freshwater productivity of salmon and sea trout populations. These tables also include some work which will be carried out by our partner organisations, not just Natural Resources Wales (NRW).

NRW has a duty, defined in the Environment (Wales) Act 2016 to have Sustainable Management of Natural Resources (SMNR) at the core of everything that we do. By applying the principles of SMNR in all of our activities - from agriculture, forestry and flood defence to development planning - we are undertaking catchment-wide initiatives that will deliver for fish stock improvements. Our reports highlight the importance of considering the whole catchment when identifying and addressing fisheries issues; and of working with partners.

NRW is committed to reporting on the status of salmon stocks in all of our principal salmon rivers for the Salmon Action Plans and condition assessments under the Habitats Directive in SAC rivers; all fish species in all of our rivers are reported for the Water Framework Directive (WFD). This report will fulfil these commitments and provide an informative and useful summary of stock status and remedial work planned, for our customers, specifically anglers, fishery and land owners; as well as our partners.

River Ystwyth

The River

The Ystwyth rises at above 600 AOD, to the remote uplands of the Cambrian Mountains in the east of the catchment. The Ystwyth has a catchment area of 196 km², and runs 39.9 km westerly through rocky valleys, tracts of coniferous forest, to the glacial lowlands of deciduous woodland and low lying pasture before entering Cardigan Bay.

The catchment only comprises of developed areas along the lowland floodplain, with much of the population settled at Aberystwyth itself, with few other settlements of any appreciable size.

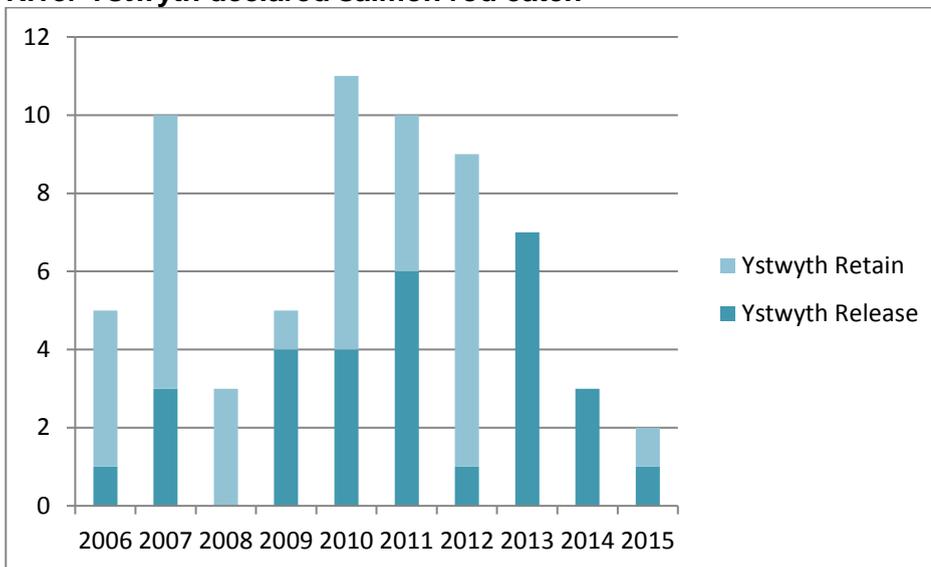

Remnants of the historic mining are to be found throughout the catchment in the shape of old mine adits, spoil tips, lakes and tracks. The mining industry has also had a great impact on water quality, the fishery and the general ecosystem of the river.

Rod Catches

The following graphs show the total declared rod catches, including numbers released or killed for salmon and salmon and sea trout on the Aeron.

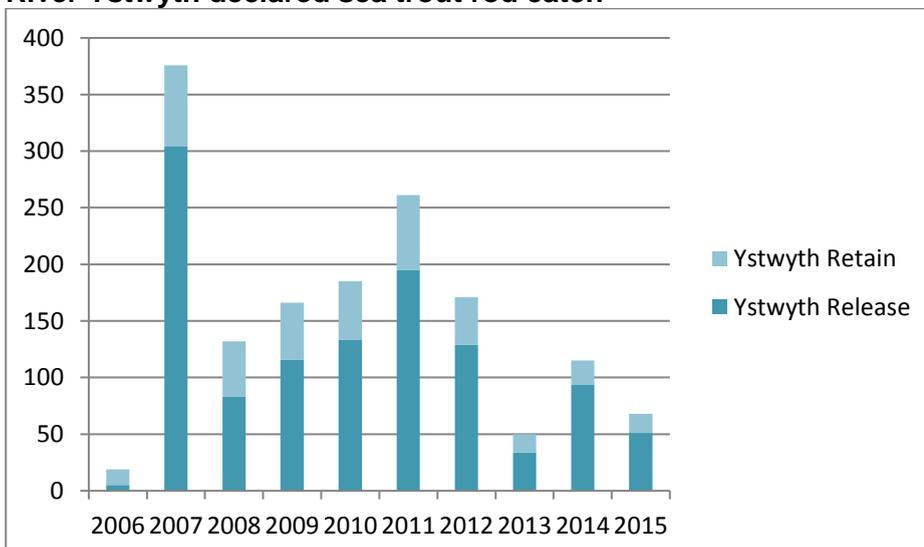

Declared salmon rod catches are variable over the 10 year period, the lowest catches were in 2008, 2014 and 2015. The highest catches were recorded in 2010 and in 2011. The average proportion of salmon catch returned alive for the period shown is 49%. The release rate in 2015 was 50% which is much lower than the Wales average of 60%.

River Ystwyth declared salmon rod catch

Declared rod catch for sea trout are also variable over the 10 year period, but reported sea trout catches exceed those of salmon in all years. The lowest recorded catches are in 2006 and 2013. The average proportion of sea trout catch returned alive for the period shown is 68%. The release rate in 2015 was 75% which is slightly higher than the average figure for Wales of 72%.

River Ystwyth declared sea trout rod catch

Stock Status

Conservation of Salmon

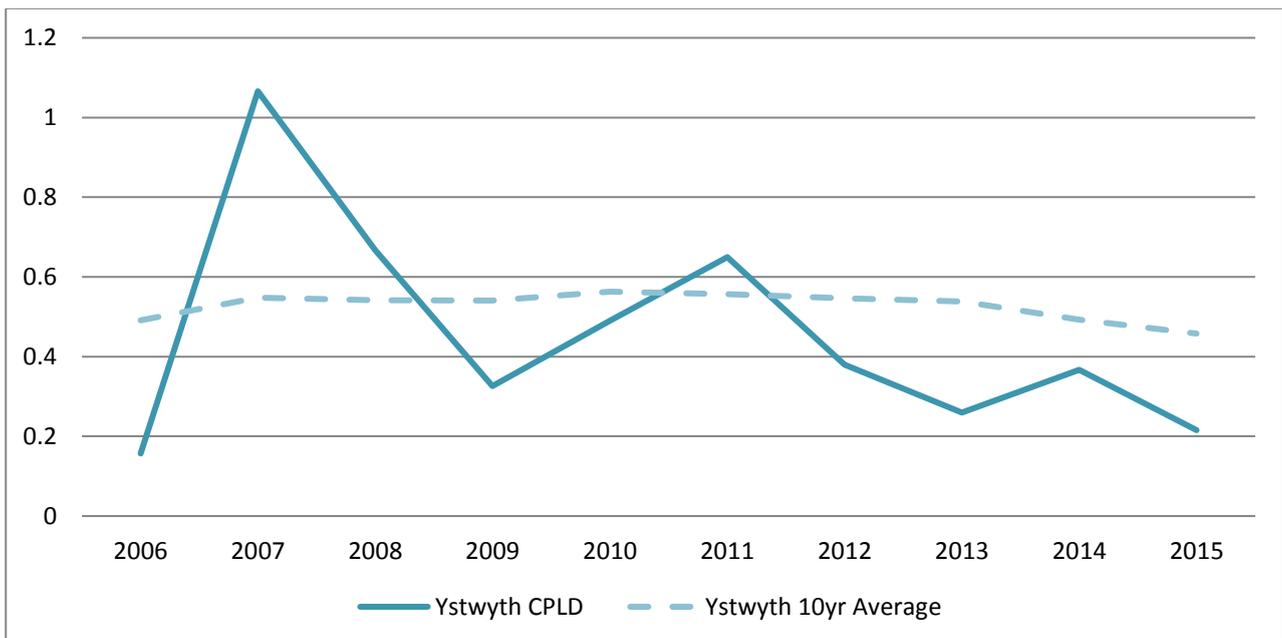

Salmon stock status is assessed through the use of 'Conservation Limits' which provide an objective reference point against which to assess the status of salmon stocks in individual rivers. The numbers of salmon a river can produce (and consequently the catches that the stocks support) are a function of the quality and quantity of accessible spawning and rearing area. This is why, in general, big rivers have larger catches and have correspondingly bigger total spawning requirements than small rivers. Thus, for any given rivers there should be an optimum level of stock which the CL seeks to protect. The conservation limit represents the number of eggs that must be deposited each year within a given catchment in order to conserve salmon stocks in the future.

In the case of the Ystwyth, the low reported rod catches of salmon mean that it is not possible to obtain an accurate estimation of egg deposition for the river, due to the potential errors involved. Assessment of compliance against the conservation limit has therefore not been attempted.

Conservation of Sea Trout

Our approach to assessing sea trout stock performance is still under development. It is based on catch trends in the last three years compared with those in the previous ten. The assessment gives an early warning about potential problems and assists with considering whether any further management actions are required. It provides an indication of changes in fishery performance, though this is not always a reflection of stock performance.

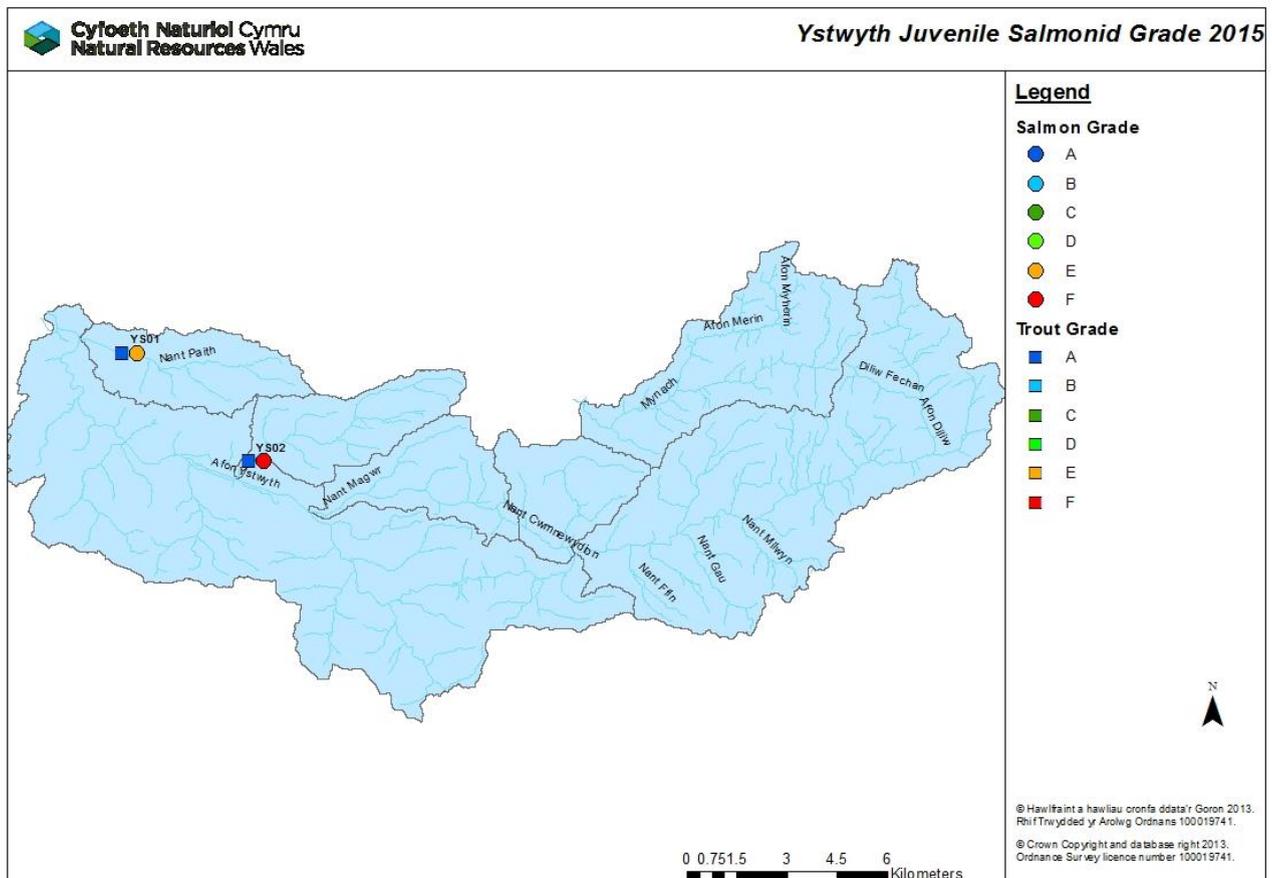

Catch Per License Day (CPLD) is the average number of fish caught for each day fished on the river and as such accounts for the variability in the amount of fishing effort between years. These statistics can be a better guide than simply looking at the total catch. The CPLD figures for the Aeron for the period 2006 to 2015 are shown below. Catch per Licence Day on the Ystwyth shows a downward trend, and the Ystwyth sea trout fishery is currently classified as '**at Risk**'.

Juvenile Monitoring

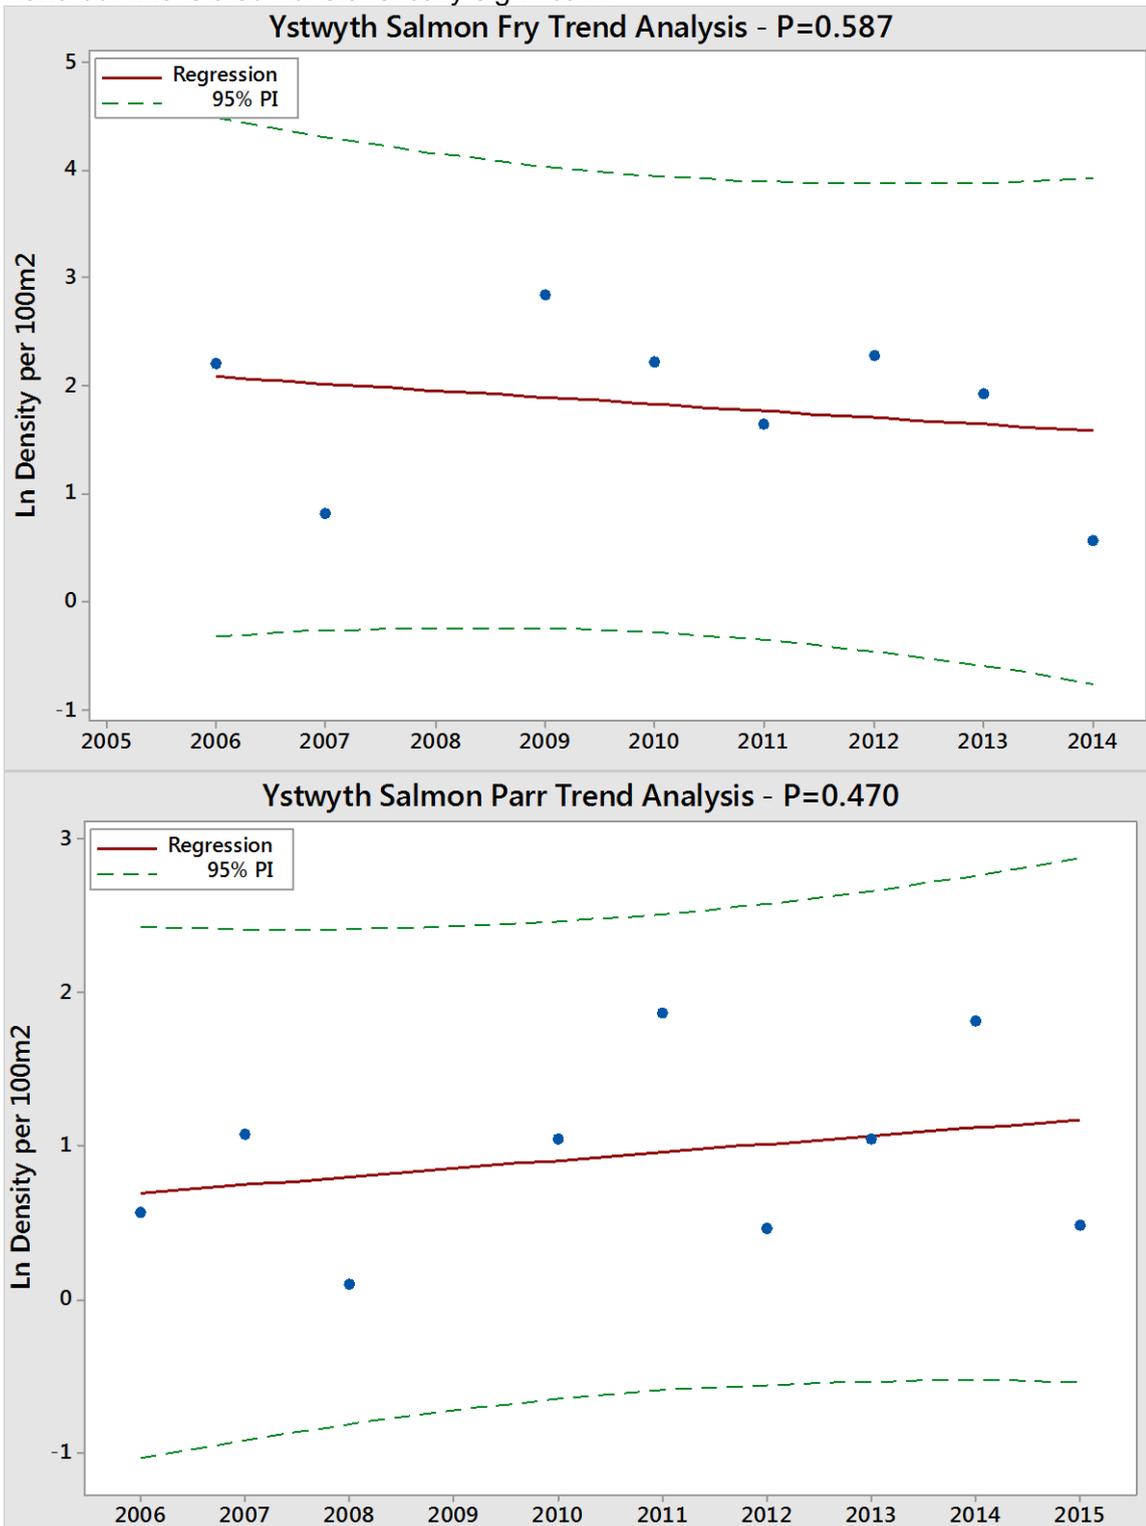

The following maps show results of the 2015 juvenile salmonid populations gathered from electro fishing surveys. They display the National Fish Classification (NFC) grades which have been developed to evaluate and compare the results of fish population surveys in a consistent manner. The NFC ranks survey data by comparing fish abundance at the survey sites with sites nationally where juvenile salmonids are present. Sites are classified into categories A to F, depending on densities of juvenile salmonids at the site. The following table shows the values and classification of NFC.

GRADE	Descriptor	Interpretation
A	Excellent	In the top 20% for a fishery of this type
B	Good	In the top 40% for a fishery of this type
C	Fair	In the middle 20% for a fishery of this type
D	Fair	In the bottom 40% for a fishery of this type
E	Poor	In the bottom 20% for a fishery of this type
F	Fishless	No fish of this type present

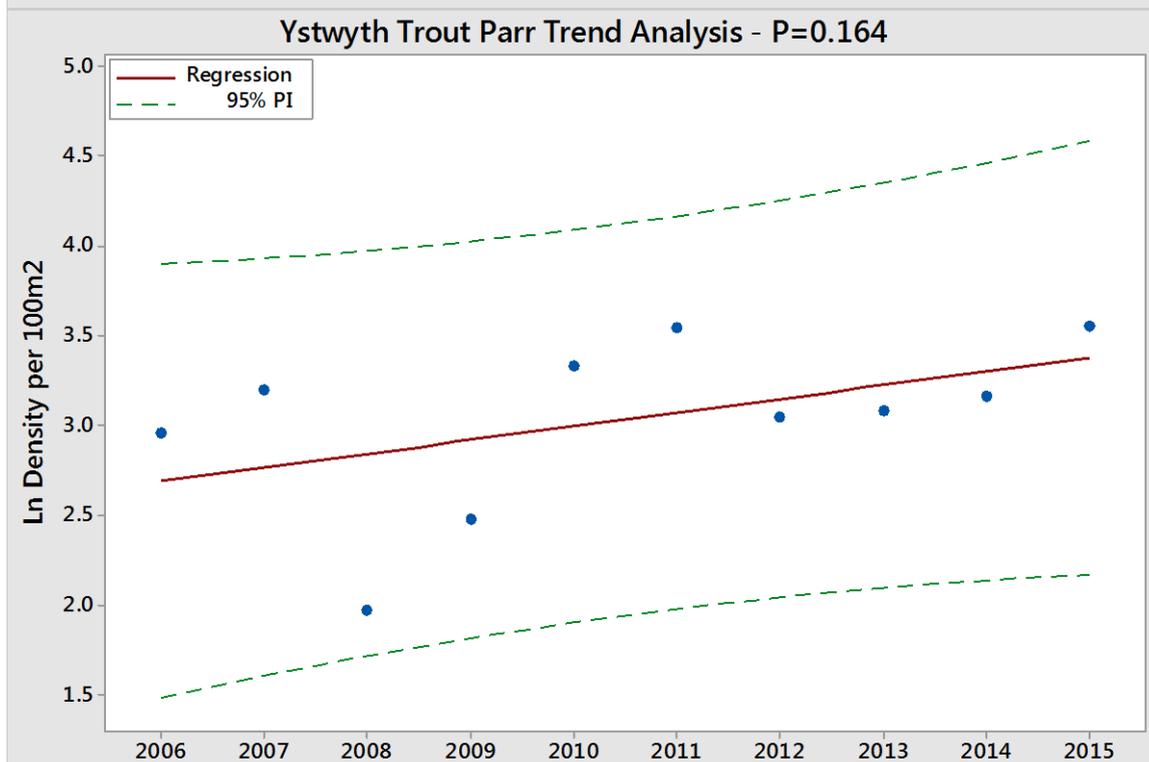

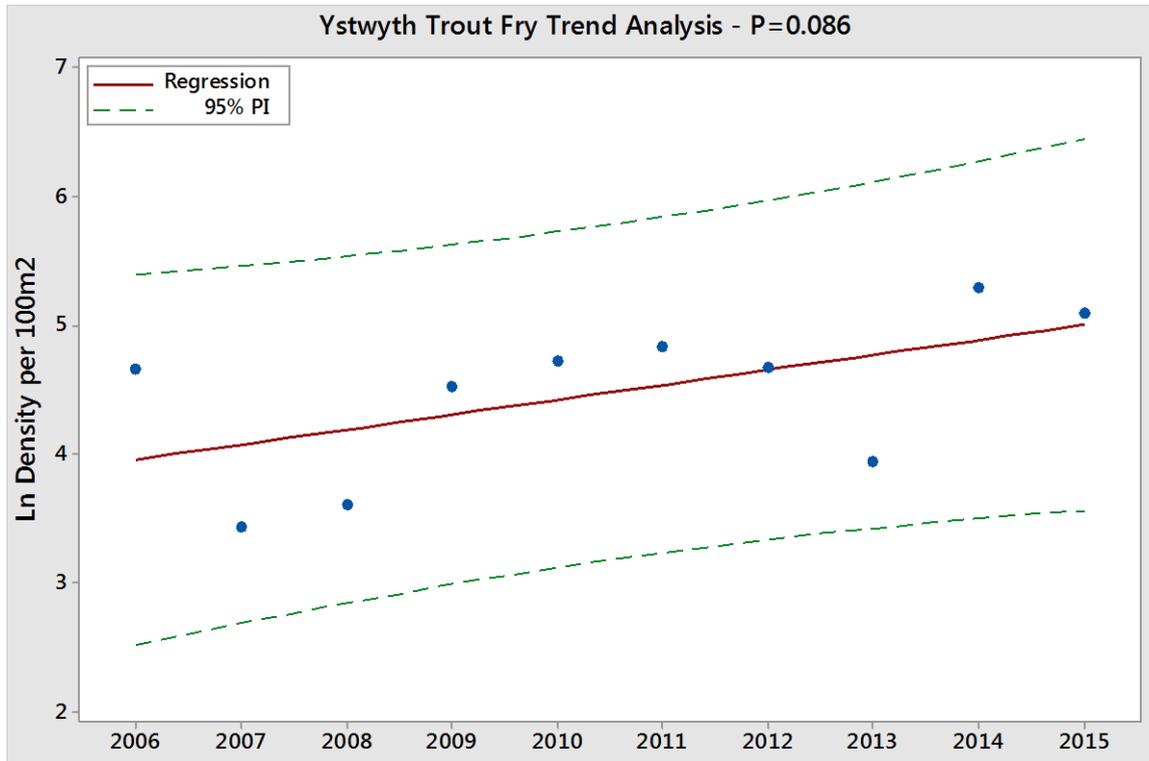

Juvenile Trend Analysis

Salmon have not been found consistently at both sites on the Ystwyth. The fry data shows a slightly upward trend but this is not statistically significant. The parr data shows a slight upwards trend but this is also not statistically significant.

Juvenile trout data shows very similar trends for both fry and parr data. Both sets of data show a slightly upward trend however neither of these trends are statistically significant.

Know Your River – River Ystwyth Salmon and Sea Trout Catchment Summary

Fisheries Mitigation Plan

Site	Mitigation action	Benefits	Lead	Partner(s)	Timescales for delivery
Ystwyth	Habitat improvements: We will investigate where there is opportunity to improve habitat for fish through improving access over barriers, restoration of riparian and instream habitat, including control of invasive species	More natural river system, reduced siltation, increased flow diversity, improved spawning gravels and juvenile habitat. Improved fish numbers.	NRW		Ongoing
	Water Framework Directive: We will continue to work to ensure no deterioration, monitor the status of the environment and investigate the causes of failures. Together with our partners we will look to put in place measures that protect and improve the status of the water environment.	<ul style="list-style-type: none"> Waterbodies protected and improved WFD waterbodies achieving Good Status/Potential 	NRW	NRW Wildlife trusts Local Authorities Landowners DCWW	Ongoing
	Enforcement: Action to reduce illegal activity on information provided and investigations.	Reduce illegal activity, more fish remain in the system.	NRW	Stakeholders SW Wales Police	Ongoing
